Assumptions: Dose Calculation • Firm Compression • Uniform Cross Section • 0.5 cm Adipose Layer - Top & Bottom • Adipose / Gland Mix: - 100% / 0% - 50% / 50% - 0% / 100%

Slide 23

Slide 24

Steps: Dose Calculation

- Measure X_a, Exposure In-Air at Surface
- ◆ Determine kV_p & Target Material
- Determine Compressed Breast Thickness
- Measure HVL (Type 1145 Aluminum)
- Estimate Adipose / Glandular Mix
- ◆ Look Up (D_{gN})_{ave} in Table
- Calculate $(D_g)_{ave} = (D_{gN})_{ave} * X_a$

Randomized Controlled Trial (RCT)

The study design that most effectively removes such differences and minimizes selection bias is the Randomized Controlled Trial (RCT- sometimes Randomized Clinical Trial.) Additionally, this design is straightforward: Subjects are randomly assigned to two (or more) groups at time zero, and deaths (or adverse events) due to the target disease are counted during the time between randomization and some predetermined end of the study.

Diagnostic mammography of symptomatic women should always be performed when indicated, utilizing recommended equipment and techniques and well-trained, | | Summary | |
| Slide 65 SC-72 DRAFT Conclusions 1. Mammography, in conjunction with physical examination, is the method of choice for early detection of breast cancer. Other methods should not be substituted for mammography in diagnosis or screening. but may be useful adjuncts in specific diagnosic situations. Slide 66 SC-72 DRAFT Conclusions 2. Diagnostic mammography of symptomatic women should always be performed when indicated, utilizing recommended equipment and techniques and well-trained, | | V Sammary | |

| | SC-12 DIAI 1 Coliciusions | |
| | 3. Screen-film mammography requires dedicated x- | |
| | ray units, firm compression, and an x-ray | |
| | spectrum produced by an appropriate combination of x-ray tube target, tube window, filtration, peak | |
| | generating potential, screen-film combination, | |
| | film processors, technique, and viewing | |
| | conditions. Craniocaudal and mediolateral | |
| | oblique views are recommended as the standard | |
| | views for all types of mammography | |
| | | |

| | SC-72 DRAFT Conclusions | |
| | | |
| | Average glandular dose should be determined at each installation for the | |
| | techniques used at representative breast | |
| | thicknesses. This dose can be calculated | |
| | from data supplied in this report by | |
| | measuring beam quality and in-air exposure at the entrance surface of the breast. | |

| | SC-72 DRAFT Conclusions | |
| | 7. Annual mammographic examinations | |
| | appear to provide favorable benefit-risk | |
| | ratios in terms of breast cancer mortality in women age 50 or above, if acceptable | |
| | image quality and dose are maintained. | |

| Slide 72 | | |
| | SC-72 DRAFT Conclusions | |
| | | |
| | 8. Results of randomized clinical trials of screening mammography for women age 40 | |
| | to 49, for which 20 or more years of follow- | |
| | up is available, have shown evidence of a | |
| | substantial benefit in reducing mortality | |
| | which exceeds any risk of radiation-induced breast cancer. | |
